

## WeldEye - Insight creates value

We believe that insight creates value. This is also true in welding production – knowing your welds is key. But knowing only takes you half way. Systemizing your knowledge turns it into insight. Analyzing and documenting your insight creates value. WeldEye is a tailored software solution, which simplifies welding documentation and production management, and tracks your welding-related processes in one place, regardless of where the welding work takes place. The aim: to create value for everyone involved in the welding production.

WeldEye creates value through simplification. It manages your welding procedures and test results, and collects and compiles the as-built documentation you need at the push of a button. This cuts down on overhead costs due to less manual work. WeldEye is dedicated to welding excellence, so our system also keeps track of personnel qualifications. Which qualification is up for renewal? Who is qualified for what kind of projects? WeldEye knows, and gives you peace of mind.

WeldEye creates value through giving you more control. It gives you more information about your welding projects by offering traceability and quick documentation creation from start to finish. You can trace any work stream, from any site, keeping an eye on how your welders or your subcontractors are performing, and how your projects are progressing. Since WeldEye monitors compliance with international welding standards, it also functions as a quality controller, making sure that you are always on top of your welding projects.

WeldEye creates value through increased efficiency. The solution collects, systemizes and provides information about individual welding operations as well as test results. This transparency means that welders can systematically improve their welding by reviewing prior work. The added transparency also means a defect can be spotted earlier, and be fixed immediately. WeldEye provides a new level of traceability to your welding production. If a batch of filler is found to be faulty, WeldEye knows exactly which welds were done with that filler batch. At the end of the day, this boosts your efficiency by reducing the need for repair work. More information allows project managers to take both quicker and better decisions, and simplifies the documentation process.

WeldEye creates value through being a universal solution. It works with all welding equipment brands. It is available globally, and all you need to access it is an online device – no need to install special software. WeldEye is available in multiple languages, and can easily be integrated into existing IT solutions – it is able to interact seamlessly with your HR software and ERP solutions, amongst others. This cloud-based solution is a simple way to control your welding production anywhere in the world, regardless of your location.

WeldEye creates value through being built with future-proof technology. The solution packs cutting edge technology under the hood, providing excellent IT security and robust operations.

The system is also automatically updated when new standards are introduced –and you know your work is compliant with current demands and standards.

To sum up: in any project or industry where welding is carried out, WeldEye simplifies your welding production, creating value every step of the way.

*Knowledge is power. Insight creates value.*
